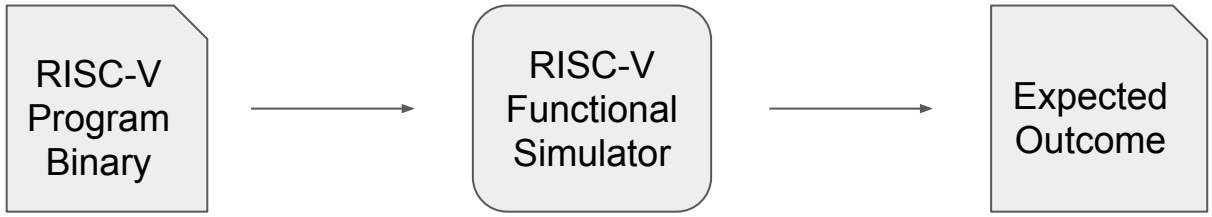
Project 1: A RISC-V Functional Simulator

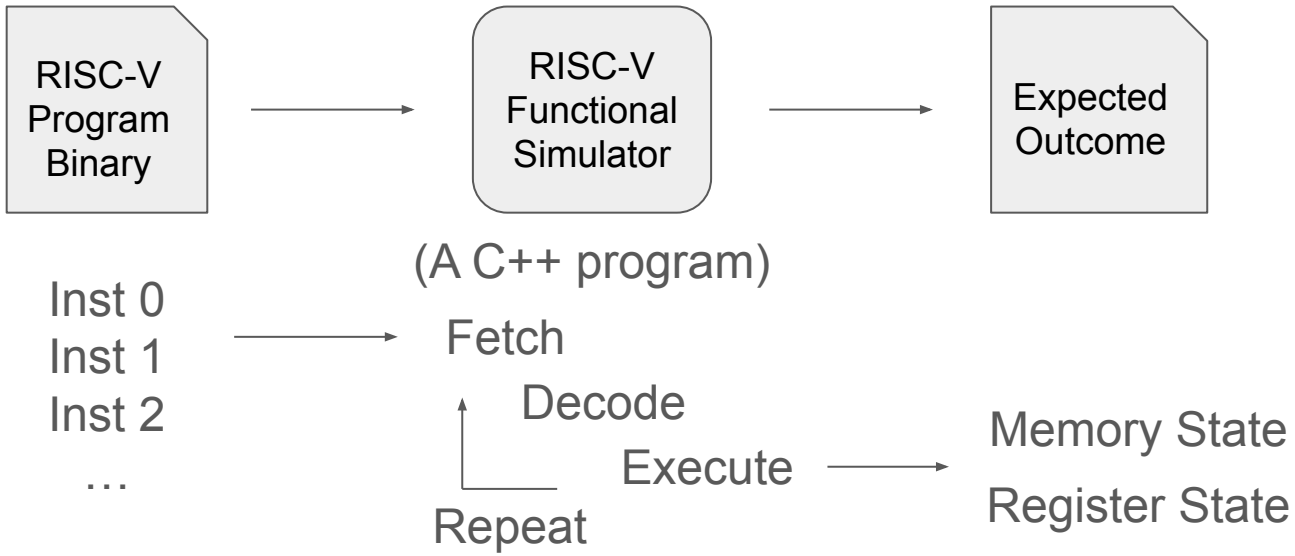
(Due Oct 3 at 6pm)

Functional Simulation



- “Simulates” what (not how) a RISC-V computer would respond to a given program.
- Useful for assessing an ISA’s functionality before any hardware implementations.
- Also useful in production, for example when emulating old hardware.
- Project 2 will be a cycle-accurate simulator building upon this functional simulator.

Simulator Overview



- No advanced C++ features needed: you may write in C style.
- A provided template already implements one instruction (ADDI).
- You are expected to work on the Nobel cluster.

Instructions to Implement

- A subset of RV64I (those bounded in red in the RISC-V green sheet).
- This green sheet is taken from the first edition of the textbook.
- A separate orange sheet details each instruction to implement, including any caveats.

Notes: 1) The Word version only operates on the rightmost 32 bits of a 64-bit registers
2) Operation assumes unsigned integers (instead of 2's complement)
3) The least significant bit of the branch address in jalr is set to 0
4) (signed) Load instructions extend the sign bit of data to fill the 64-bit register
5) Replicates the sign bit to fill in the leftmost bits of the result during right shift
6) Multiply with one operand signed and one unsigned
7) The Single version does a single-precision operation using the rightmost 32 bits of a 64-bit F register
8) Classify writes a 10-bit mask to show which properties are true (e.g., −inf, -0,+0, +inf, denorm, ...)
9) Atomic memory operation; nothing else can interpose itself between the read and the write of the memory location
The immediate field is sign-extended in RISC-V

Example Instruction: ADDI

- Each instruction in RV64I is encoded as a 32-bit word. Use opcode and funct code bits to determine the instruction.
- Use relevant bits to determine source and destination registers.
- Update the register file, the memory, and the program counter if necessary.

```
* ADDI

 - Summary   : Add constant
 - Assembly  : addi rd, rs1, imm
 - Semantics : R[rd] = R[rs1] + sext64(imm)
 - Format    : I-type, I-immediate

  31                  20 19     15 14  12 11      7 6           0

```

Testing

- Test cases are written in RISC-V assembly (.s files).
- Two test cases are provided:
  - add.s covering ADDI, the only implemented instruction for now.
  - fib.s, a program to compute the first few Fibonacci numbers.
- Write more tests to cover more instructions as you implement them. Pay attention to corner cases.
- Your submissions will be graded using a private suite of test cases.

Steps to do this project:

1. Find a partner (work in groups of 2)
2. Get code onto Nobel (you are expected to work on Nobel)
3. Read the project description
4. Read provided documents
5. Understand the provided template
6. Implement more instructions (post questions to ed)
7. Write more tests on those instructions (get help in office hours)
8. Goto step 6 unless all instructions implemented
9. Write more tests on corner cases
10. Fill in Partners.md
11. Submit on canvas (Due Oct 3 at 6pm)

Appendix: Tips on Infrastructure Setup

Develop on the Nobel Machine

- Connect to Nobel via SSH following OIT guides.
  - VPN required from off-campus.
  - Want to skip duo or password when logging in? More tricks here.
- Most IDEs allow you to develop on remote clusters easily
  - e.g. “Remote - SSH” extension on VS Code. See this article for more information.
- Useful commands:
  - **ssh netId@nobel.princeton.edu** for connecting to Nobel
  - **scp localfile netId@nobel.princeton.edu:/path/to/dest** for copying a local file to Nobel
- Bash setup: Can add the following lines to .bashrc on Nobel
  - **PS1="\u@\h \w $ "** for making the prompt more informative
  - **alias ls='ls --color'** differentiates dirs and files when you run **ls**

Collaboration

- Use Git and Github to collaborate & sync code between different machines.
  - Create a new **PRIVATE** repository on Github. Do not make project code public. Add project files to the repository.
  - You can then clone the repo on multiple machines and directories (e.g. your computer, your home dir on Nobel, and your partner's home dir on Nobel). Commit and push after making changes, pull to incorporate remote changes to the local clone.
  - You may need a Personal Access Token (PAT) for Github authentication. More info here.
- It's easy to work with Git in IDEs as well: e.g. Git in VS Code. It can perform Github authentication as well.
- VS Code Live Share is a useful extension for real time collaboration.
